### Algebraic and Differential Methods for Nonlinear Control ...

Newton's method for solution of a nonlinear equation  $R(W) = 0$  starts with an initial guess  $W_0$  and generates a series of iterates  $W_k$  that each solves a linearization of the system at the previous iterate, i.e., for given  $W_k$  the next iterate  $W_{k+1}$  shall satisfy  $R(W_k) + \nabla R(W_k)(W_{k+1} - W_k) = 0$ .

The substitution method we used for linear systems is the same method we will use for nonlinear systems. We solve one equation for one variable and then substitute the result into the second equation to solve for another variable, and so on. There is, however, a variation in the possible outcomes. Lie algebraic method generalize matrix methods and algebraic rank conditions to smooth nonlinear systems. They capture the essence of noncommuting flows and give rise to noncommutative analogues of Taylor expansions. Lie algebraic rank conditions determine controllability, observability, and optimality.

### Lie-algebraic methods in nonlinear control

This book provides a unique and alternative approach to the study of nonlinear control systems, with applications. The approach presented is based on the use of algebraic methods which are intrinsically linear, rather than differential geometric methods, which are more commonly found in other reference works on the subject.

Current methods in computational nonlinear algebra can be broadly broken into two domains: symbolic and numerical. Symbolic methods often rely on the computation of Gröbner bases. On the other hand, numerical methods typically use algebraically-founded homotopy continuation, with a base field of the complex numbers.
