Lyapunov Stability Non Autonomous Dynamical

In the mathematical field of dynamical systems, an attractor is a set of states toward which a system tends to evolve, for a wide variety of starting conditions of the system. System values that get close enough to the attractor values remain close even if slightly disturbed. In finite-dimensional systems, the evolving variable may be represented algebraically as an n -dimensional vector.

En mathématiques et en automatique, la notion de stabilité de Liapounov (ou, plus correctement, de stabilité au sens de Liapounov) apparaît dans l'étude des systèmes dynamiques. De manière générale, la notion de stabilité joue également un rôle en mécanique, dans les modèles économiques, les algorithmes numériques, la mécanique quantique, la physique nucléaire, etc.

Nonlinear equations. The power series method can be applied to certain nonlinear differential equations, though with less flexibility. A very large class of nonlinear equations can be solved analytically by using the Parker-Sochacki method. Since the Parker-Sochacki method involves an expansion of the original system of ordinary differential equations through auxiliary equations, it is not ...
